

ABSTRACT TO THE DISCLOSURE

A data processing device (1) comprises processing
5 means (4) capable of receiving from equipment (3) in a
communications network primary data defining events in at
least one primary format, and delivering to a management
device in the network (2) secondary data defining alarms
representing events, in a secondary format. The processing
10 means (4) comprise an interpreter (5) provided with
conversion rules, arranged in the form of "scripts"
associated with the various primary event formats, and
arranged to convert, by means of these rules, primary data
received in one of the primary formats into secondary data
15 in the secondary format which can be interpreted by the
management device (2).
